Medplus Front Desk Application

Business Flow

4 important Business Logics.

Location Master

- A 'Fetch' button will be available.
- Upon clicking 'Fetch', the system should retrieve: `Location ID`, `Location Name`, `Latitude/Longitude`, `Type`, `City`, `State, PIN code`, and `Address`.
- The retrieved data will be saved into the application's Location Master database.

User Master

- A 'Fetch' button will be available.
- Upon clicking 'Fetch', the system should retrieve: `User Name`, `Employee ID`, `Designation`, `Role`, `Work Location`, `Department`, `Mobile Number` and `Work Email ID`.
- The retrieved data will be saved into the application's Location Master database.

User Management

The `UserManagement` table includes the following fields: `employeeid` (references `UserMaster`), `employeename`, `ipaddress`, `macaddress`, `password`, `location` (references `LocationMaster`), `status`, `role`, `createdby`, `createdat`, `modifiedby`, and `modifiedat`.

Regional Admins and Supervisors are authorized to manage receptionist details within this table, specifically the `ipaddress`, `macaddress`, and `location` fields.

When a receptionist is assigned to a location, an intimation message must be delivered via the messaging system.

The OTP service streamlines the check-in process by sending two distinct types of messages, and the image server captures and stores visitor photos.

Messages Sent:

1. **To the Visitor/Employee:** A one-time password (OTP) is sent for verification, stating: "Dear Visitor/Employee, your OTP for check-in at FrontDesk is (OTP number). This OTP must be kept strictly confidential."
2. **To the Employee Being Visited:** A notification is sent to the employee: "Dear (Employee Name), a visitor has arrived to meet you at the Front Desk."

Image Storage:

The ImageServer is responsible for storing photos taken of visitors during the check-in process, and assistance is needed to manage this process.
